ABSTRACT

In this paper, we construct numerical algorithms for solving Magnetohidrodynamics (MHD) free convection flow rate which has been discussed in detail. It is observed that, for a nonlinear system of differential equation, the spline model of nine degree is used, effectiveness and accuracy of this new method are presented. Several theorems relating the order of the ninth spline to the saturation of the estimator are proved. Some results of consistency are given and an application MHD system is given.

AMS SUBJECT CLASSIFICATION: 41A25, 65H10, 47E05.

INTRODUCTION

Consider the system of nonlinear equations

\[
\frac{dA}{dt} = f(t, u_1, u_2, u_3, \ldots, u_n) \\
A(t_0) = \eta
\]

where \( A = [u_1, u_2, u_3, \ldots, u_n]^T \), \( f = [f_1, f_2, f_3, \ldots, f_n]^T \), \( \eta = [\eta_1, \eta_2, \eta_3, \ldots, \eta_n] \).

Many problems in applied sciences and engineering are modeled as system of differential equations such as spring-mass systems, bending of beams, Magnetohydrodynamics free convection flow (MHD), chemical reactions and so forth can be formulated in terms of differential equations. Since the system of differential equations has wide applications in scientific research, so we consider the convective flow in fluid saturated porous medium which has been the subject of several recent papers. Therefore faster and accurate numerical solutions to this problem is very important, see[1-3], [5], and [12]).

There are several methods that can be used to solve the nonlinear problems numerically. A broad class of analytical solutions methods, such as Runge-Kutta of order six, Taylors series, Hirota’s bilinear scheme and Hereman's method as [6-8], [10] and [12], were used to handle these problems. However, some of spline approximation had been proposed by ([2], [4] and [11]) solved the system of differential equations and some initial value problems.

In the present paper, we discussed the convergence analysis of the ninth spline method for system of differential equations with new constraint and boundary conditions, also we apply this new model for solving magnetohydrodynamics free convection flow and mass transfer over a stretching sheet which has been analyzed numerically including the dufour and sorb effects. We will use the function, two, fourth and seventh boundary conditions, to constructed the ninth spline with two initial conditions.

DESCRIPTION OF THE METHOD

We present a ninth spline interpolation for one dimensional and for a given sufficiently smooth function \( f(x) \) defined on the interval \( I = [a, b] \), and \( \Delta_n : a = x_0 < x_1 < x_2 < \ldots < x_n = b \), denote the uniform partition of \( I \) with knots \( x_i = a + ih \), where \( i = 0, 1, 2, \ldots, n-1 \) and \( h = \frac{b - a}{n} \) is the length of each subintervals, and \( d \) the ninth spline is denoted by \( S_9(x) \) and defined on I as:

\[
s_9(x) = y_0 + (x-x_0)y_0' + \frac{(x-x_0)^2}{2}y_0'' + \frac{(x-x_0)^3}{6}y_0''' + \frac{(x-x_0)^4}{24}y_0^{(4)} + \frac{(x-x_0)^5}{120}a_{0,6} + \\
(x-x_0)^6a_{0,6} + \frac{(x-x_0)^7}{5040}y_0^{(7)} + (x-x_0)^9a_{0,8} + (x-x_0)^9a_{0,9}
\]

on the subinterval \([x_0, x_1]\) where \( a_{0,j} \), \( j = 5, 6, 7 \) are unknowns to be determined.

Let us examine subintervals \([x_i, x_{i+1}]\), \( i = 1, 2, \ldots, n-2 \). By taking into account the interpolating conditions, we can write the expression, for \( S_9(x) \) in the following form, see([2], [10] and [11]).

\[
s_i(x) = y_i + (x-x_0)a_{i,1} + \frac{(x-x_0)^2}{2}y_i'' + (x-x_0)^3a_{i,3} + \frac{(x-x_0)^4}{24}y_i^{(4)} + (x-x_0)^5a_{i,5} + \\
(x-x_0)^6a_{i,6} + \frac{(x-x_0)^7}{5040}y_i^{(7)} + (x-x_0)^9a_{i,8} + (x-x_0)^9a_{i,9},
\]

where \( a_{i,j} \), \( i = 1(1)(n-1) \), \( j = 1, 3, 5, 6, 8, 9 \). are unknown values to be determine.

CONVERGENCE ANALYSIS

In this section, we investigate the convergence analysis of the method for ninth degree spline function which are developed by [2], [4], [10] and [11]. The equation (2) yields the two initial conditions \( S'(x_0) = y'(x_0) \) and \( S''(x_0) = y''(x_0) \), and then we apply the boundary conditions

\( S^{(r)}(x_i) = y^{(r)}(x_i), r = 0, 2, 4, 7, \) for \( i = 0, 1, \ldots, n \) in equation (3), to obtain the following:
\[a_{0.5} = \frac{198}{41h^3} \left[ y_1 - y_0 \right] - \frac{198}{41h^2} \frac{4}{141h} y_0' - \frac{239}{410h^2} y_0'' - \frac{1}{410h} \left[ 91y_0'' + 899y_0' \right] + \]
\[\frac{h}{4920} \left[ 25y_1^{(4)} - 469y_0^{(4)} \right] - \frac{h^2}{516600} \left[ 12y_1^{(7)} - 35y_0^{(7)} \right],\]
\[a_{0.6} = \frac{192}{41h^3} \left[ y_1 - y_0 \right] + \frac{192}{41h^2} y_0' + \frac{617}{1230h} y_0'' + \frac{1}{3099600h} \left[ 864360y_0'' + 6393240y_0' \right] - \frac{1}{3099600h} \left[ 23100y_1^{(4)} - 195720y_0^{(4)} \right] + \frac{h}{309600} \left[ 122y_1^{(7)} - 595y_0^{(7)} \right],\]
\[a_{0.8} = \frac{45}{41h^3} \left[ y_1 - y_0 \right] - \frac{45}{41h^2} y_0' - \frac{9}{82h} y_0'' - \frac{1}{826560h^6} \left[ 60480y_0'' + 393129y_0' \right] + \frac{1}{36400h^3} \left[ 20y_1^{(4)} + 25y_0^{(4)} \right] - \frac{1}{1834560h} \left[ 64y_1^{(7)} + 161y_0^{(7)} \right],\]
and
\[a_{0.9} = -\frac{10}{41h} \left[ y_1 - y_0 \right] + \frac{10}{41h^2} y_0' + \frac{1}{2479680h} \left[ 40320y_0'' + 262080y_0' \right] - \frac{1}{2479680h^2} \left[ 1680y_1^{(4)} - 6720y_0^{(4)} \right] + \frac{1}{2479680h^2} \left[ 29y_1^{(7)} + 35y_0^{(7)} \right].\]

Substituting these values of \(a_{0.5}, a_{0.6}, a_{0.8}\) and \(a_{0.9}\) in equation (2), we obtain:
\[a_{1,1} = \frac{108}{41h^3} \left[ y_1 - y_0 \right] - \frac{67}{41h^2} y_0' + \frac{13h^2}{205} y_0'' - \frac{1}{410} \left[ 51y_0'' - 181y_0' \right] - \frac{h}{4920} \left[ 5y_1^{(4)} + 21y_0^{(4)} \right] + \frac{h}{4132800} \left[ 11y_1^{(7)} - 15y_0^{(7)} \right],\]
and
\[6a_{1,3} = -\frac{1080}{41h} \left[ y_1 - y_0 \right] + \frac{1080}{41h^2} y_0' + \frac{67}{41h} y_0'' + \frac{1}{41h} \left[ 154y_0'' + 386y_0' \right] + \frac{h}{246} \left[ 23y_1^{(4)} + 31y_0^{(4)} \right] - \frac{h^4}{103320} \left[ 13y_1^{(7)} - 14y_0^{(7)} \right].\]

We shall find the coefficients of \(S_i(x)\) for \(i = 1, 2, 3, ..., n - 1\). From equation (3) we have:
\[a_{1,5} = \frac{198}{41h^3} \left[ y_{i+1} - y_i \right] - \frac{198}{41h^2} a_{1,4} - \frac{717}{205h} a_{1,4} - \frac{1}{516600h} \left[ 114660y_0'' + 113274y_0' \right] + \frac{1}{516600h} \left[ 2625y_1^{(4)} - 49245y_0^{(4)} \right] - \frac{h^2}{516600} \left[ 12y_0^{(7)} - 35y_0^{(7)} \right].\]
\[a_{1,6} = -\frac{192}{141h^3} \left[ y_{i+1} - y_i \right] + \frac{192}{141h^2} a_{1,4} + 617 \frac{1}{205h} a_{1,4} + \frac{1}{3099600h} \left[ 864360y_0'' + 6393240y_0' \right] - \frac{1}{309600h^2} \left[ 23100y_1^{(4)} - 195720y_0^{(4)} \right] + \frac{1}{309600h} \left[ 122y_0^{(7)} - 595y_0^{(7)} \right],\]
\[a_{1,8} = \frac{45}{41h^3} \left[ y_{i+1} - y_i \right] - \frac{45}{41h^2} a_{1,4} - \frac{27}{41h} a_{1,4} - \frac{1}{826560h^6} \left[ 60480y_0'' + 393129y_0' \right] + \frac{1}{826560h^3} \left[ 2520y_1^{(4)} + 10080y_0^{(4)} \right] - \frac{1}{826560h} \left[ 23y_1^{(7)} + 73y_0^{(7)} \right],\]
and
\[a_{1,9} = -\frac{10}{41h} \left[ y_{i+1} - y_i \right] + \frac{10}{41h^2} a_{1,4} + \frac{6}{41h} a_{1,4} + \frac{1}{2479680h^2} \left[ 60480y_0'' + 262080y_0' \right] - \frac{1}{2479680h^2} \left[ 1680y_1^{(4)} - 6720y_0^{(4)} \right] + \frac{1}{2479680h^2} \left[ 29y_1^{(7)} + 35y_0^{(7)} \right].\]
Substituting the values of \( a_{i,5}, a_{i,6}, a_{i,8} \) and \( a_{i,9} \) in the equation (3), we obtain the following relation, for \( i = 1, 2, ..., n - 1 \).

\[
a_{i+1,1} = \frac{108}{41h} [y_{i+1} - y_i] - \frac{108}{41} a_{i,7} - \frac{13h^2}{205} a_{i,3} + \frac{h}{410} [51y_{i+1}^3 - 181y_i^3] - \\
\frac{h^3}{4920} [5y_{i+1}^4 + 21y_i^4] - \frac{h^6}{4132800} [11y_{i+1}^5 - 15y_i^5],
\]

and

\[
a_{i+1,3} = -\frac{1080}{41h^3} [y_{i+1} - y_i] + \frac{1080}{41h^2} a_{i,7} + \frac{402}{41} a_{i,3} + \frac{1}{41h} [154y_{i+1}^3 + 386y_i^3] + \\
\frac{h}{246} [23y_{i+1}^4 + 31y_i^4] - \frac{h^2}{103320} [13y_{i+1}^5 - 14y_i^5].
\]

Now the coefficient matrix of the above system of equations can be found, in the unknowns \( a_{i,1}, a_{i,3}, a_{i,1,1} \) and \( a_{i,1,3} \), \( i = 1, 2, ..., n - 1 \) which is a non-singular matrix and hence all the coefficients are determined uniquely.

**Theorem 1:** Let \( y(x) \) be the exact solution of the system (1) and we assuming that \( y_i, i = 1, 2, ..., n - 1 \) be the numerical solution of (1), and \( S(x) \) be a unique ninth spline function which is a solution of the problem (2). Then for \( x \in [x_0, x_1] \), we have:

\[
\| S^{(9-\alpha)}(x) - y^{(9-\alpha)}(x) \| \leq \frac{49}{47232} h'w_g(f; h), r = 9, \\
\frac{125}{68880} h'w_g(f; h), r = 7, \\
\frac{182}{41} h'w_g(f; h), r = 1,
\]

where \( A = \frac{323324628002651}{57640752303423423488}, B = \frac{1551065516263567}{9223372036854775808} \).

And where \( W_g(f; h) \) denotes the modules of continuity of \( y^{(9)} \).

**Proof:** Let \( x \in [x_0, x_1] \), from equation (2.1) and by using Taylor’s expansion formula we get

\[
S^{(9)}(x) - y^{(9)}(x) = 362880a_{0,9} - y^{(9)}(x).
\]

Using (2) and \( a_{0,9} \), we obtain

\[
\| S^{(9)}(x) - y^{(9)}(x) \| \leq \frac{135}{41} w_g(f; h).
\]

By taking the eight derivatives and subtracting the function, using Taylor’s series expansion on \( y^{(9)}(x) \) about \( x = x_1 \), we get

\[
S^{(8)}(x) - y^{(8)}(x) = 40320a_{0,8} + 362880(x - x_1)a_{0,9} - y^{(8)}(x_0) + (x - x_0)y^{(9)}(x_1)
\]

\[
\leq \frac{182}{41} h w_g(f; h) \text{ where } x_0 < x_1 < x_1.
\]

Also, from (2) and by taking the seventh derivatives, we get

\[
S^{(7)}(x) - y^{(7)}(x) = y^{(7)}_0 + 40320a_{0,8} + 181440h^2 a_{0,9} - y^{(7)}(x),
\]

hence

\[
\| S^{(7)}(x) - y^{(7)}(x) \| \leq \frac{229}{82} h^2 w_g(f; h). \]
and by taking the sixth derivatives and from the Taylor’s series expansion on $y^{(6)}(x)$ about $x = x_1$, we get:

$$\left| S_y^{(6)}(x) - y^{(6)}(x) \right| \leq \frac{675}{574} h^6 y^{(9)}(x)$$

(8)

From equations (2) and substituting the coefficients, we get:

$$\left| S_y^{(5)}(x) - y^{(5)}(x) \right| \leq \frac{893}{2296} h^5 y^{(9)}(x)$$

(9)

By continuing this process, we have

$$\left| S_y^{(4)}(x) - y^{(4)}(x) \right| \leq \frac{125}{1148} h^4 y^{(9)}(x)$$

$$\left| S_y^{(3)}(x) - y^{(3)}(x) \right| \leq \frac{323324628002651}{57640752303423423488} h^3 y^{(9)}(x)$$

(10)

and

$$\left| S_y^{(2)}(x) - y^{(2)}(x) \right| \leq \frac{49}{47232} h^2 y^{(9)}(x)$$

$$\left| S_y(x) - y(x) \right| \leq \frac{1551065516263567}{9223372036854775808} h^6 y^{(9)}(x)$$

Lemma 1: Let $y(x)$ be the exact solution of the system of (1.1). Assume that $y_i, i = 1, 2, ..., n-1$, be the numerical solutions of (1), then

$$e_{i,1} = c_i h^i y^{(i)}(x)$$

(10)

and $c_i$ depend on the numbers of intervals.

Proof: For $y(x) \in C^9[0,1]$, then using Taylor’s expansion formula, we have:

$$y(x) = y(x_i) + (x-x_i)^{y''}(x_i) + \frac{(x-x_i)^2}{2} y^{(3)}(x_i) + ... + \frac{(x-x_i)^9}{5040} y^{(9)}(x_i),$$

where $x_i < x_1 < x_{i+1}$, and similar expressions for the derivatives of $y(x)$ can be used.

Now if $i=1$ then from equation of $a_{1,1}$ and by using (10) we obtain

$$e_{i,1} = c_{i,1} = y^{(1)}(x_{i+1}) - y^{(1)}(x_i)$$

(11)

where $x_0 < x_1 < x_2 < x_3 < x_4 < x_5 < x_6 < x_7$.

From equation (11) we get:

$$e_{i,1} \leq \frac{h^8}{330624} y^{(9)}(x_i)$$

where $c_i = \frac{1}{330624}$ Also, if $i=2$, then from the expression of $a_{2,1}$ and by using (10) we obtain

$$e_{2,1} = c_{2,1} h^8 y^{(9)}(x)$$

Continuing the same process, the inequality

$$\left| e_{i,1} \right| \leq c_i h^i y^{(i)}(x)$$

for $i = 1, ..., n-1$ holds.

Lemma 2: Let $y(x)$ be the exact solution of the system of (1.1). Assume that $y_i, i = 1, 2, ..., n-1$, be the numerical solutions of (1), then

$$e_{i,1} = c_{i,1} h^i y^{(i)}(x)$$

(12)

where $e_{i,1} = 6 c_{i,3} x - y_i^{(m)}$

and $c_i'$ depend on the numbers of intervals.
Proof: Let \( y(x) \in C^9[0,1] \) and by using the Taylor’s expansion formula and similar expressions for the derivatives of \( y(x) \), we have, if \( i = 1 \) then from the expressions \( a_{i,3} \) and from equation (12), we obtain

\[
e_{1,3} = 6a_{i,3} - y'' = -\frac{h^6}{13776} y^{(9)}(\alpha_i) + \frac{11h^6}{14760} y^{(9)}(\alpha_2) - \frac{h^6}{720} y^{(9)}(\alpha_3) + 23h^6 \frac{y^{(9)}(\alpha_5) - 13h^6 y^{(9)}(\alpha_6)}{206640} + \frac{y^{(10)}(h \alpha_1)}{29520} - \frac{y^{(10)}(h \alpha_2)}{10886400} - \frac{y^{(10)}(h \alpha_3)}{774960000} - \frac{y^{(10)}(h \alpha_4)}{67597440000} + \frac{y^{(10)}(h \alpha_5)}{748872000000} - \frac{y^{(10)}(h \alpha_6)}{85900320000000}
\]

where \( x_0 < \alpha_1 < \alpha_2 < \alpha_3 < \alpha_4 < \alpha_5 < \alpha_6 < x_1 \).

and thus, we get: \( |e_{1,3}| \leq \frac{h^6}{656} w_h(f; h) \) and \( c_i = \frac{1}{656} \)

Also, if \( i = 2 \) then from \( a_{i,3} \) and equation (12), we get \( |e_{2,3}| \leq c_2^* h^6 w_h(f; h) \)

Similarly the inequality \( |e_{i,3}| \leq c_i^* h^7 w_h(f; h) \) for \( i = 1, ..., n \) holds.

Theorem 2: Let \( S(x) \) be a unique spline function of ninth degree and \( y(x) \in C^9[0,1] \) be the solution of (2). Then for \( x \in [x_i, x_{i+1}] \); \( i = 1, 2, ..., n-1 \), the following error bounds are holds:

\[
\left\| S^{(r)}(x) - y^{(r)}(x) \right\| \leq \begin{cases} \frac{h^r}{a}(ac_i + bc_i' + c) w_h(f; h), & r = 0, \\ \frac{h^r}{47232}(47232c_i + 23616c_i' + 49) w_h(f; h), & r = 1, \\ \frac{h^r}{57640675230343488}(3233246283002651 c_i + 1823) w_h(f; h), & r = 2, \\ \frac{h^r}{68880}(68880c_i + 1823) w_h(f; h), & r = 3, \\ \frac{h^r}{2296}(893i + 2296) w_h(f; h), & r = 4, \\ \frac{h^r}{1148}(125i + 1148) w_h(f; h), & r = 5, \\ \frac{h^r}{574}(135i + 574) w_h(f; h), & r = 6, \\ \frac{h^r}{41}(229i + 41) w_h(f; h), & r = 7, \\ \frac{h^r}{229}(182i + 229) w_h(f; h), & r = 8, \\ \frac{h^r}{182}(135i + 182) w_h(f; h), & r = 9, \\ \end{cases}
\]

\( a = 3689348814741903232, b = 614891469126816900, c = 6204260265054268, \)

Proof: Let \( x \in [x_i, x_{i+1}] \) where \( i = 1, 2, ..., n-1 \), then from equation (3) and using Taylor’s expansion formula we get

\[
S^{(9)}(x) - y^{(9)}(x) = 362880a_{1,9} - y^{(9)}(x)(14)
\]

Using (2) and \( a_{1,9} \), we obtain

\[
\left| S^{(9)}(x) - y^{(9)}(x) \right| = \left| 362880a_{1,9} - y^{(9)}(x) \right| \leq \frac{135i}{41} w_h(f; h)(15)
\]

From (2) and by taking the eight derivatives and subtracting the function \( y^{(8)}(x) \), and using Taylor’s series expansion on \( y^{(8)}(x) \) about \( x = x_i \), we get

\[
\left| S^{(8)}(x) - y^{(8)}(x) \right| \leq \frac{182i}{41} w_h(f; h) \text{ where } x_i < \alpha_{i,1} < x_i \quad (16)
\]

Also, from (3) and taking the seventh derivatives, we get

\[
\left| S^{(7)}(x) - y^{(7)}(x) \right| \leq \frac{229i}{82} h^2 w_h(f; h) \text{ where } x_i < \alpha_{i,2} < x_i. \quad (17)
\]

And by taking the sixth derivatives with using Taylor’s series expansion on \( y^{(6)}(x) \) about \( x = x_i \), we get

163 | Page  
May-June, 2013
\[
|S_i^{(6)}(x) - y^{(6)}(x)| \leq \frac{675i}{574} h^5 |x^{(9)}(\alpha_1) - y^{(9)}(\alpha_2)| \leq \frac{675i}{574} h^5 w_9(f;h) \quad (18)
\]

where \( x_i < \alpha_{i,3}, \alpha_{i,4} < x_{i+1}, \) and also
\[
|S_i^{(5)}(x) - y^{(5)}(x)| \leq \frac{125i}{1148} h^4 w_9(f;h) \quad \text{where } x_i < \alpha_{i,3}, \alpha_{i,4}, \alpha_{i,5} < x_{i+1} \quad (19)
\]

by the same process way we can find that:
\[
|S_i^{(4)}(x) - y^{(4)}(x)| \leq \frac{893i}{2296} h^3 w_9(f;h),
\]
\[
|S_i^{(3)}(x) - y^{(3)}(x)| \leq \frac{i h^6}{68880} (68880c_i' + 1823) w_9(f;h)
\]

Now using lemma (4) and (5), we obtain
\[
|S_i(x) - y(x)| \leq h^7 c_i' w_9(f;h) + \frac{3233246283002651i}{576460752303423488} h^8 w_9(f;h)
\]
\[
\leq (h^7 c_i' + \frac{3233246283002651i}{576460752303423488}) w_9(f;h)
\]

\[
|S_i'(x) - y'| \leq |a_{i,1} - y'| + \frac{h^2}{2} |6a_{i,3} - y_7| + |5h^4 a_{i,5} + 6h^5 a_{i,6} + 8h^7 a_{i,8} + 9h^8 a_{i,9}|
\]
\[
\leq \frac{h^8}{47232} (47232 c_i + 23616 c_i' + 49) w_9(f;h)
\]

and
\[
|S_i(x) - y(x)| \leq h^9 (a_{i,1} - y'_7) w_9(f;h) + \frac{h^9}{6} (6a_{i,3} - y_7) w_9(f;h) + \frac{6204262065054268 h^9}{3689348814741903232} w_9(f;h) \leq \frac{h^9}{a} (a c_i + b c_i' + c) w_9(f;h)
\]

where
\[
a = 3689348814741903232, \quad b = 614891469126816900, \quad c = 6204262065054268.
\]

This proves Theorem 2 for \( x \in [x_i, x_{i+1}], i = 1, 2, \ldots, n - 1 \)

**NUMERICAL ILLUSTRATION**

In this section, the nonlinear differential system of Magnetohidrodynamics free convection flow is presented and this problem is referred to [8] and [9]. The problems are tested to the efficiency of the development solutions, and to demonstrate its convergence computationally. The problems have been solved by using our method with different values of step size \( h \); it’s tabulated in Tables 1. These show that our results are more accurate.

Problem 1 [8]: Consider the system
\[
f - f' + f'' = 0, \quad f(0) = f'(0) = 0
\]
\[
\theta' - r \Pr \theta + \Pr f \theta' = 0
\]
\[
\varphi' + \text{Sc} \varphi + \text{Sr} \varphi' = 0
\]

Where
\[
f = f, \quad f' = 1, \quad \theta' = 1, \quad \varphi' = 1, \quad \text{at } \eta = 0,
\]
\[
f = 0, \quad \theta = 0, \quad \varphi = 0, \quad \text{at } \eta \rightarrow \infty
\]

The following notations will indicate in the tables:

- **TOL**: Tolerance
- **FS**: Total failure steps
and \( \text{TIME (ms)} \) The execution time taken in microseconds.

The absolute of maximum error with respect to derivatives defined as [4]:

\[
\text{AMAXE}_{(0)}^{\iota} = \max_{x \in \mathbb{R}} \| e_{(0)}^{(j)} \| = \max_{x \in \mathbb{R}} \| s^{(j)}(x) - f^{(j)}(x) \| \quad \text{AMAXE}_{(\phi)}^{\iota} = \max_{x \in \mathbb{R}} \| e_{(\phi)}^{(j)} \| = \max_{x \in \mathbb{R}} \| s^{(j)}(x) - \varphi^{(j)}(x) \|
\]

and \( \text{AMAXE}_{(\theta)}^{\iota} = \max_{x \in \mathbb{R}} \| e_{(\theta)}^{(j)} \| = \max_{x \in \mathbb{R}} \| s^{(j)}(x) - \theta^{(j)}(x) \| \)

Where \( j \) be the order of derivatives on whole intervals and \( f(x_i), \varphi(x_i) \) and \( \theta(x_i) \) are the approximate solution of system (20). we can see from Taylors expansion that \( S'(x_0) = f'(x_0) \) and \( S''(x_0) = f''(x_0) \), \( S'(x_0) = \varphi'(x_0) \) and \( S''(x_0) = \varphi''(x_0) \) and \( S'(x_0) = \theta'(x_0) \) and \( S''(x_0) = \theta''(x_0) \).

CONCLUSION

The approximate solutions of the nonlinear problems as differential system of Magnetohydrodynamics free convection flow by using ninth spline interpolation show that our method is better in the sense of accuracy and applicability. These have been verified by maximum absolute errors given in the tables it changes with respect to the step size of the tolerance and various problems. Some properties of spline are obtained which are required in proving the uniqueness, existences and convergence analysis of the present method.
